

1 Certify reference + bridge

Simultaneous fine-token laws for reference p and target q

$$\Pr(\mathcal{E}_p \cap \mathcal{E}_q) \geq 1 - \delta$$

missing target stratum forces abstention

2 Optimize on the same table

The event covers every stochastic release channel

$$M \in \text{Stoch}(K, L)$$

continuum-wide, no channel-count penalty

jointly select M and decoder g

3 Certify target membership

A robust bridge LP learns one common transform and retained mass

$$q_s = \hat{t}_y p_s \hat{T}_y + (1 - \hat{t}_y) r_s$$

certify membership or abstain

4 Persist only if certified

Within-label Bayes source attacker plus the registered task decoder

same token on every later query

otherwise: **ABSTAIN**
